

ACTIVITY 4 - CONTROL STRUCTURES

branch name: js-activity-4

ACTIVITY 4 - CONTROL-STRUCTURES

Task 1

Objective - Create a function that checks if a person is eligible to vote based on their age

Instruction

1. Create a function called `checkEligibility` that accepts an `age` as an argument
2. Inside the function, check if the age is greater than or 18
3. If the age is greater than or equal to 18, return the message "You are eligible to vote!"
4. Otherwise, return the message "You are not eligible to vote yet"

Task 2

Objective - Create a function that compare two numbers and provide feedback on their relationship

Instruction

1. Create a function called `compareNumbers` that takes two numbers as arguments: `num1` and `num2`
2. Inside the function, compare `num1` and `num2` to determine which one is greater or if they are equal
3. If `num1` is greater than `num2`, return the message "num1 is greater than num2"
4. If `num2` is greater than `num1`, return the message "num2 is greater than num1"
5. If `num1` is equal to `num2`, return the message "Both numbers are equal."

ACTIVITY 4 - CONTROL-STRUCTURES

Task 3

Objective - Create a function that provides a weather message based on a given temperature in Celsius

Instruction

1. Create a function called `temperatureCheck` that accepts `temperature` (in Celsius) as an argument
2. Inside the function, determine the appropriate message based on the temperature range
3. If the temperature is below 0 degrees, return "It's freezing!"
4. If the temperature is between 0 and 15 degrees, return "It's cold."
5. If the temperature is between 16 and 25 degrees, return "It's moderate."
6. If the temperature is above 25 degrees, return "It's hot!"

Task 4

Objective - Create a function that assigns a letter grade based on a student's score

Instruction

1. Create a function called `evaluateGrade` that takes a `score` as an argument
2. Inside the function, use conditional statements to determine the corresponding letter grade based on the following scale
3. If score is 90 or above, return "A"
4. If score is between 80 and 89, return "B"
5. If score is between 70 and 79, return "C"
6. If score is between 60 and 69, return "D"
7. If score is between 50 and 59, return "F"

ACTIVITY 4 - CONTROL-STRUCTURES

1. Write a method with a while loop to print 1 through n in square brackets.
For example, if $n = 6$ print [1] [2] [3] [4] [5] [6]
2. Write a method with a while loop that computes the sum of first n positive integers: $\text{sum} = 1 + 2 + 3 + \dots + n$ Examples: $n = 5$ $\text{sum} = 15$ $n = 19$ $\text{sum} = 190$
3. Write a function that sums the multiples of 3 and 5 under 1000.

ACTIVITY 4 - CONTROL-STRUCTURES

Write a loop that outputs this

**

*
